

MathML? Good Idea :)

Date: 2014-08-22 07:20:00

$$x = -b \pm \sqrt{b^2 - 4ac} / 2a$$

See the above, this is all MathML Magic and when we take a look at the source, plain text:

```
<math xmlns="http://www.w3.org/1998/Math/MathML" display="block">
  <mrow>
    <mi>x</mi>
    <mo>=</mo>
    <mfrac>
      <mrow>
        <mo>±</mo>
        <mi>b</mi>
        <mo>±</mo>
        <msqrt>
          <mrow>
            <msup>
              <mi>b</mi>
              <mn>2</mn>
            </msup>
            <mo>-</mo>
            <mn>4</mn>
            <mi>a</mi>
            <mi>c</mi>
          </mrow>
        </msqrt>
      </mrow>
      <mn>2</mn>
      <mi>a</mi>
    </mfrac>
  </mrow>
</math>
```

Yeah, quite complex, let us take the amazing [Pythagorean theorem](#):

$$a^2 + b^2 = c^2$$

The code would look like this:

```
<math xmlns="http://www.w3.org/1998/Math/MathML" display="block">
  <mrow>
    <msup><mi>a</mi><mn>2</mn></msup>
    <mo>+</mo>
    <msup><mi>b</mi><mn>2</mn></msup>
    <mo>=</mo>
    <msup><mi>c</mi><mn>2</mn></msup>
  </mrow>
</math>
```

If you want more examples [click here](#) for the [W3C](#) ones.

Stay :yin_yang: and keep coding :)
